IT 112 WEB SYSTEMS AND TECHNOLOGIES

BU TRANSAKTO

FINAL PROJECT PROPOSAL

GROUP NAME: KMJ's

MEMBERS:

BELLEN, JUVY

HERMO, MA. MERA

INTIA, KIMBERLY ANNE

REALUBIT, JANET

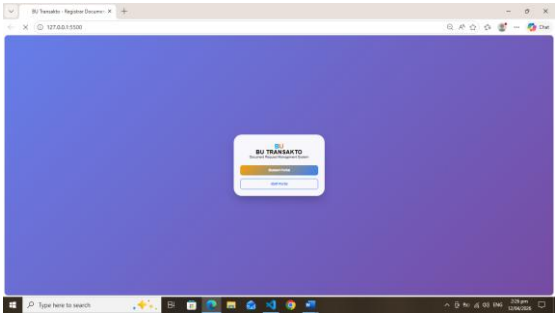
SEPTO, JESSECA

COURSE & BLOCK:

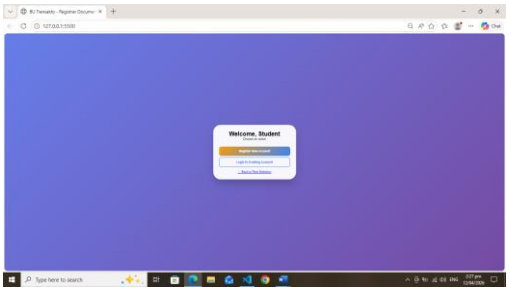
BSIT-2A

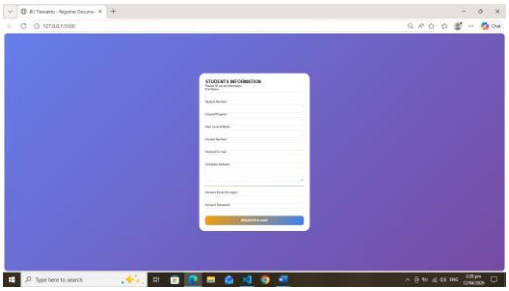
Screenshot of ALL working Front-end

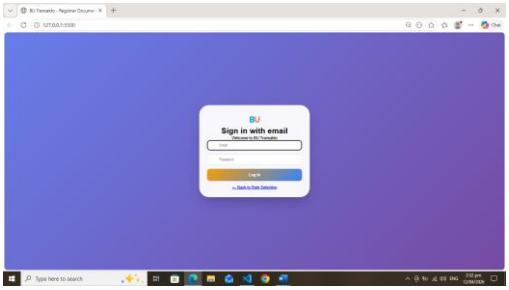
User Selection

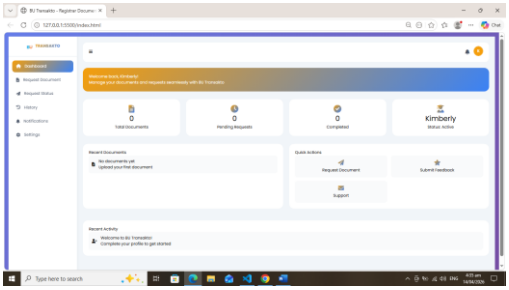


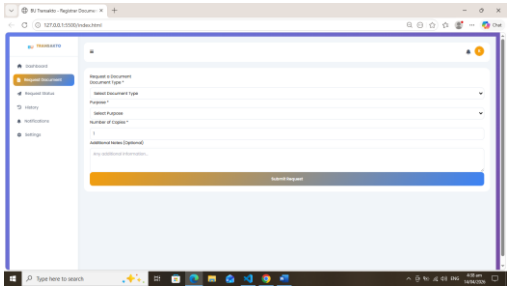
Student Interface

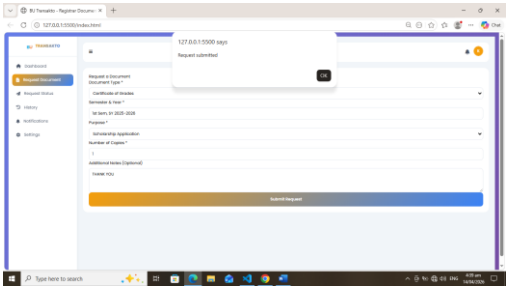


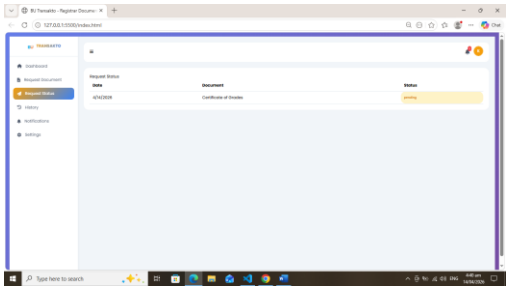


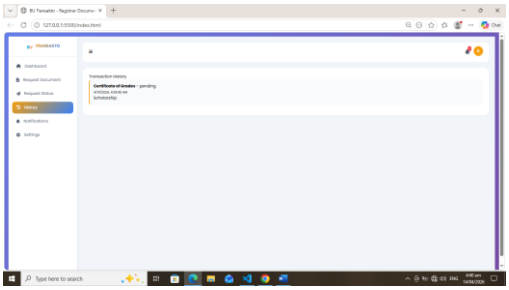


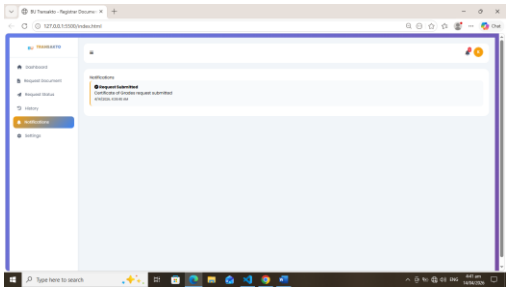


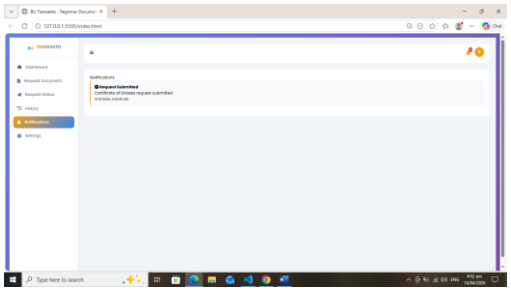


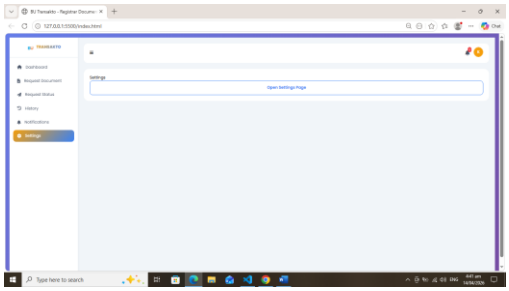


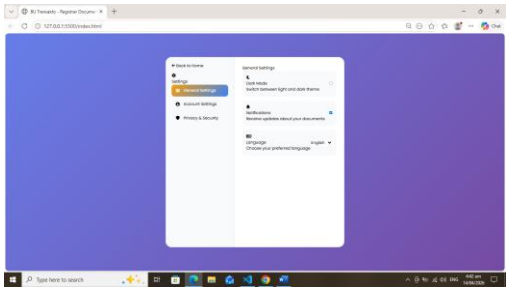


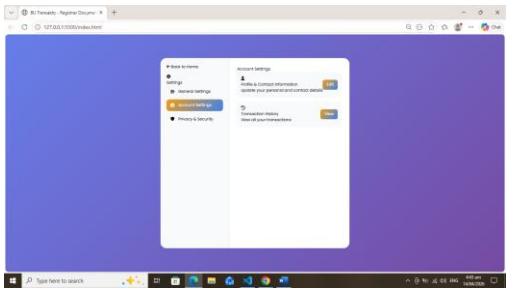


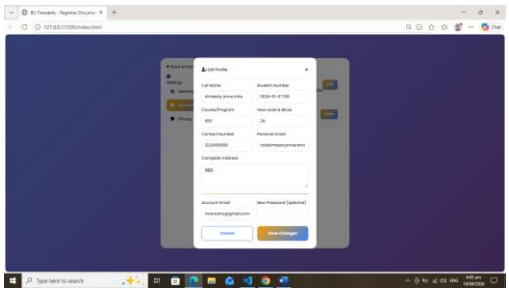


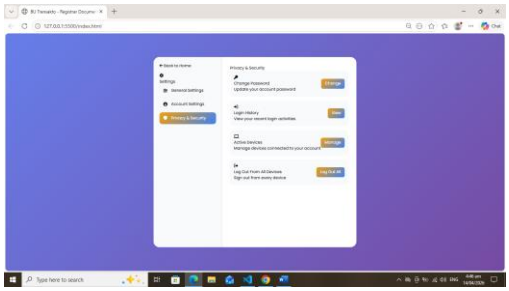


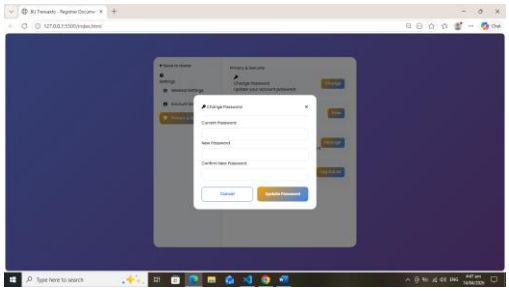


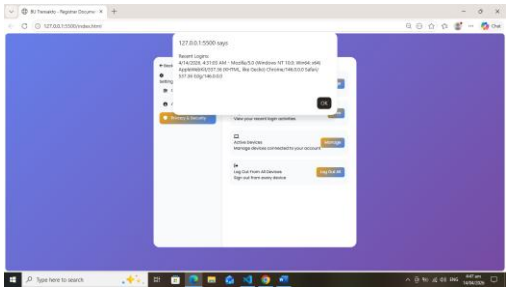


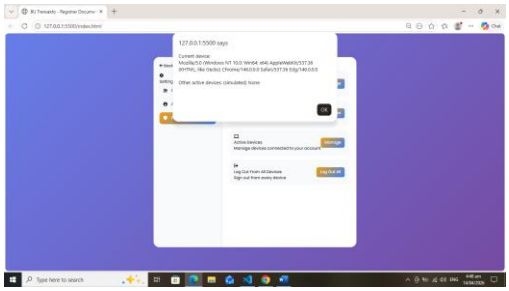


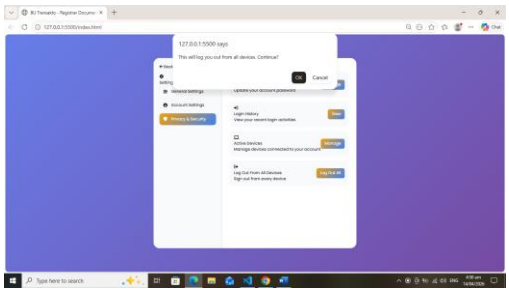


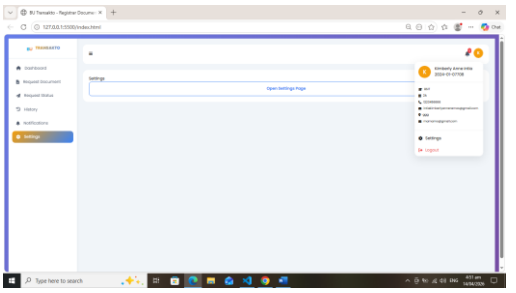


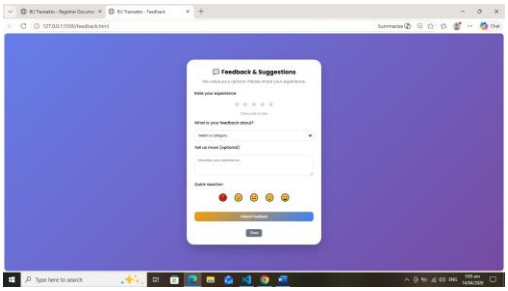


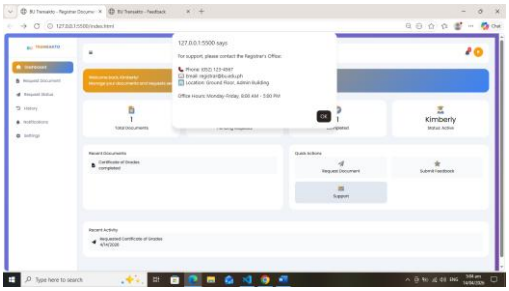




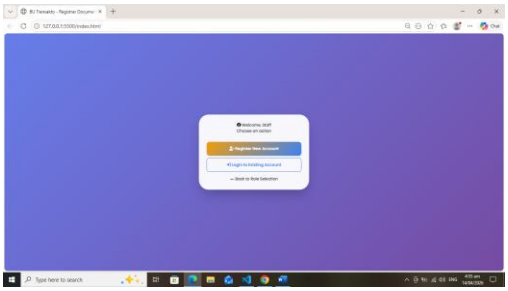


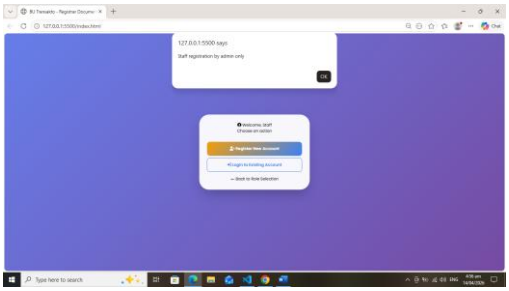


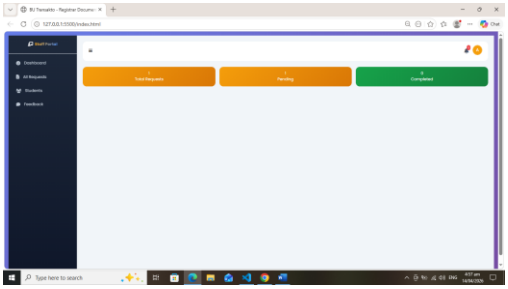


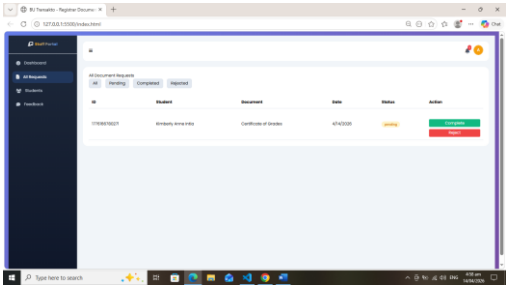


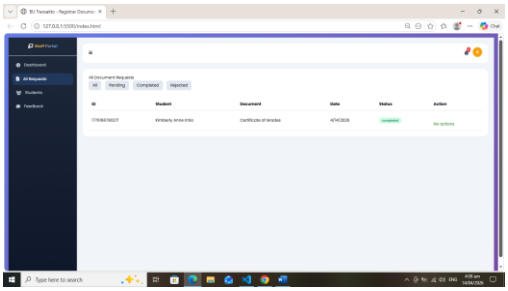
Staff Interface

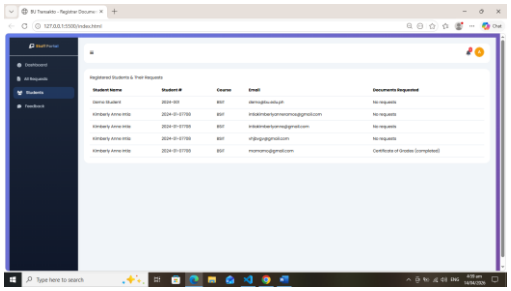


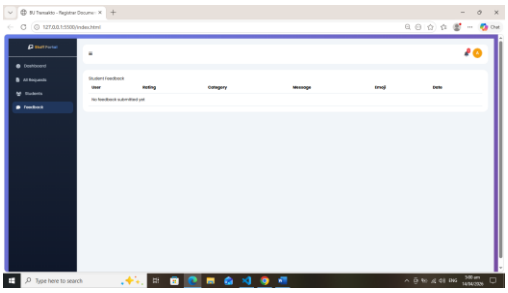


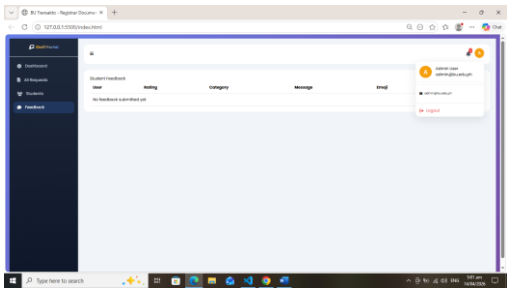












Annotation of Features/Use-case each Page Cover

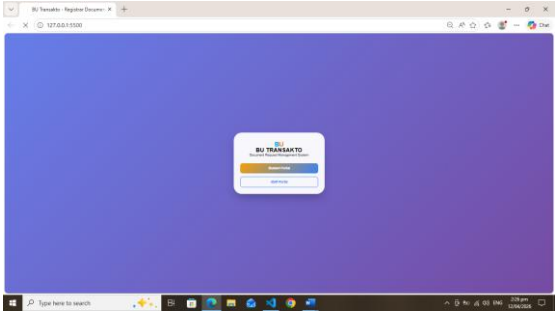


Figure 1: Landing Page (User Role Selection) – implements Select User Role Use Case.

This page serves as the entry point of the system where users choose whether they are a student or staff, ensuring they are directed to the correct interface and functionalities.

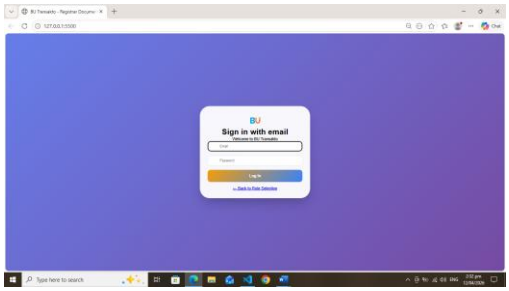

Figure 2: Login Page – implements User Authentication Use Case.

This page allows both students and staff to log in by entering their username and password to securely access the system.

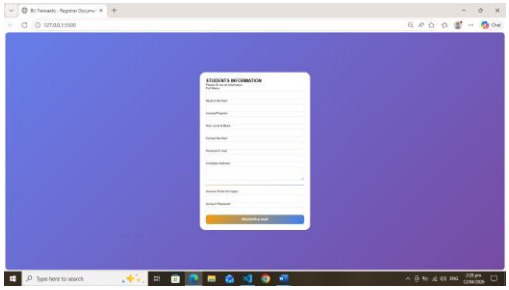

Figure 3: Registration Page – implements User Registration Use Case.

This page enables new student users to create an account by providing required personal and login details for system access.

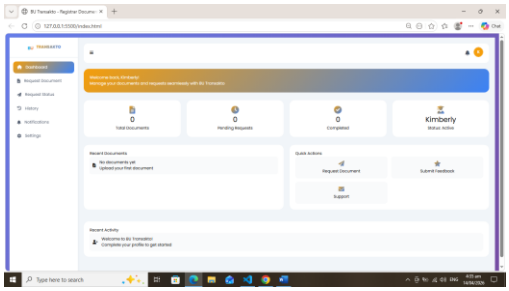

Figure 4: Student Dashboard – implements View Dashboard Use Case.

This page displays the main interface for students, providing quick access to request documents, track requests, view notifications, and manage their profile.

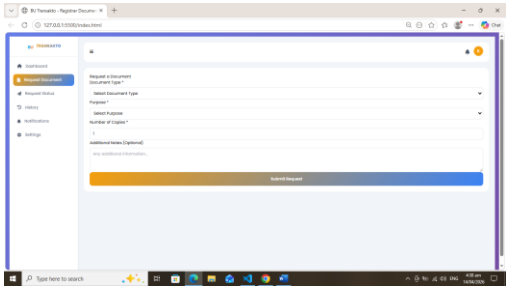

Figure 5: Document Request Page – implements Submit Document Request Use Case.

This page allows students to select a document type, fill out required information, and submit a request to the registrar.

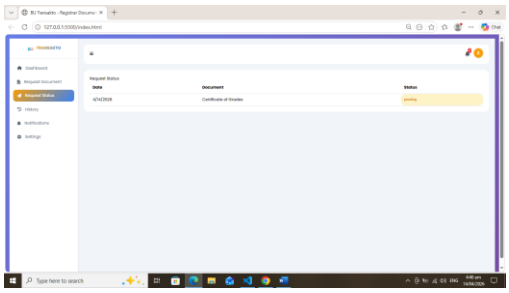

Figure 6: Request Status Page- implements Track Request Status Use Case

This page allows students to monitor the progress of their submitted document request, showing status such as pending, approved, rejected, or completed

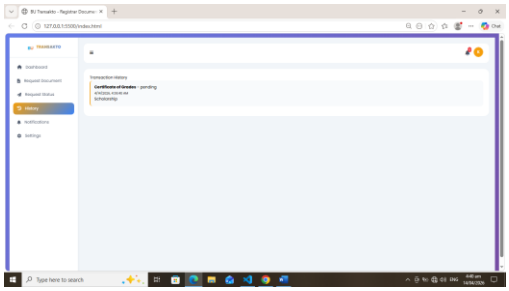

Figure 7: Request History Page – implements View Request Status Use Case.

This page shows all submitted document requests along with their current status (pending, approved, rejected, or completed).

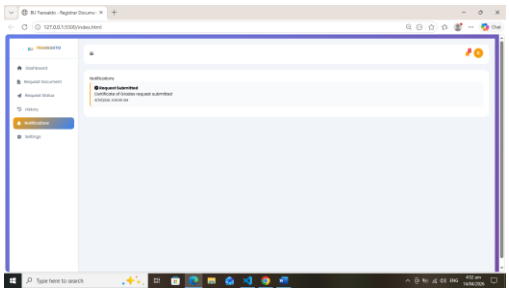

Figure 8: Notifications Page – implements Receive Notifications Use Case.

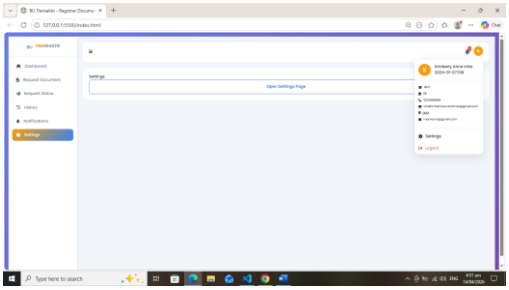
This page provides students with updates and alerts regarding their document requests and system announcements.



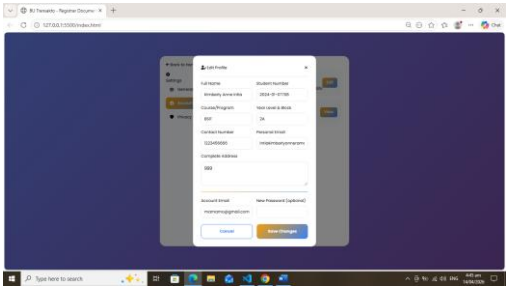


Figure 9: Profile Page – implements Manage User Profile Use Case.

This page allows students to view and update their personal information and account credentials.

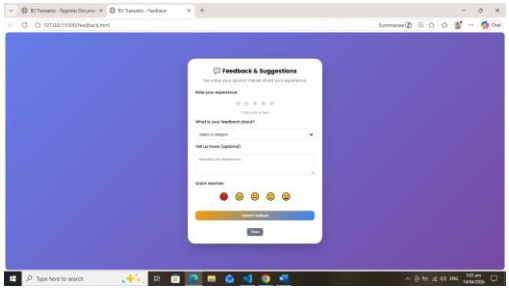

Figure 10: Feedback / Support Page – implements Submit Feedback and Report Issue Use Case.

This page enables students to send feedback, suggestions, inquiries, or report system issues, including features like FAQs and support messaging.

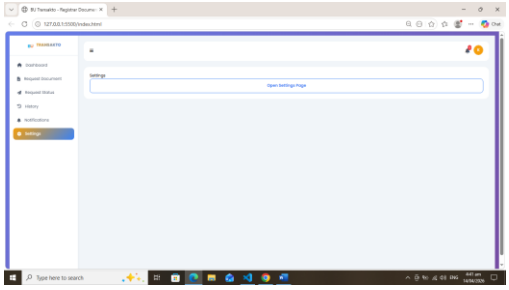

Figure 11: Settings Page (Student) – implements Manage Account Settings Use Case.

This page allows students to customize their account settings such as changing password, managing preferences, and configuring system options.

Staff Interface

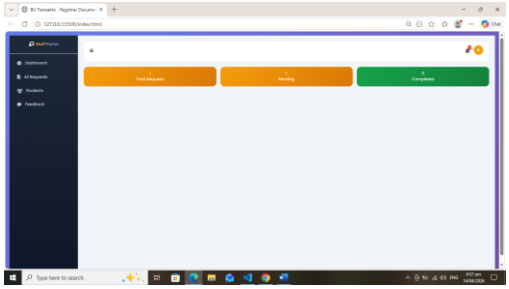

Figure 12: Staff Dashboard – implements Monitor Requests Use Case.

This page provides staff with an overview of all incoming document requests and system activities for efficient monitoring.

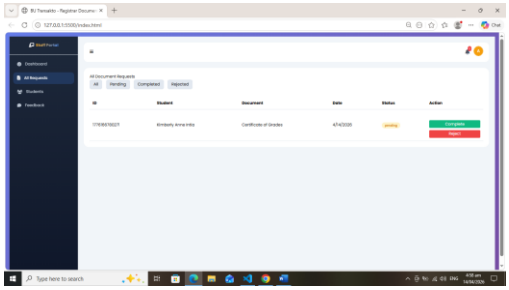

Figure 13: Manage Requests Page – implements Process Document Requests Use Case.

This page allows staff to review submitted requests and perform actions such as approving, rejecting, or updating the status of each request.

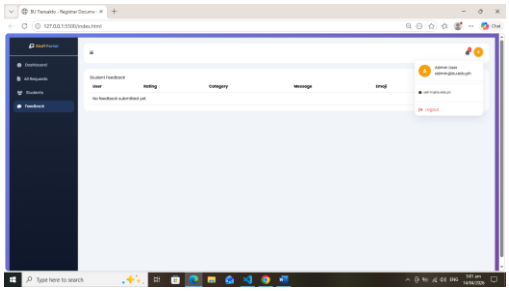

Figure 14: Staff Profile Page – implements Manage Staff Account Use Case.

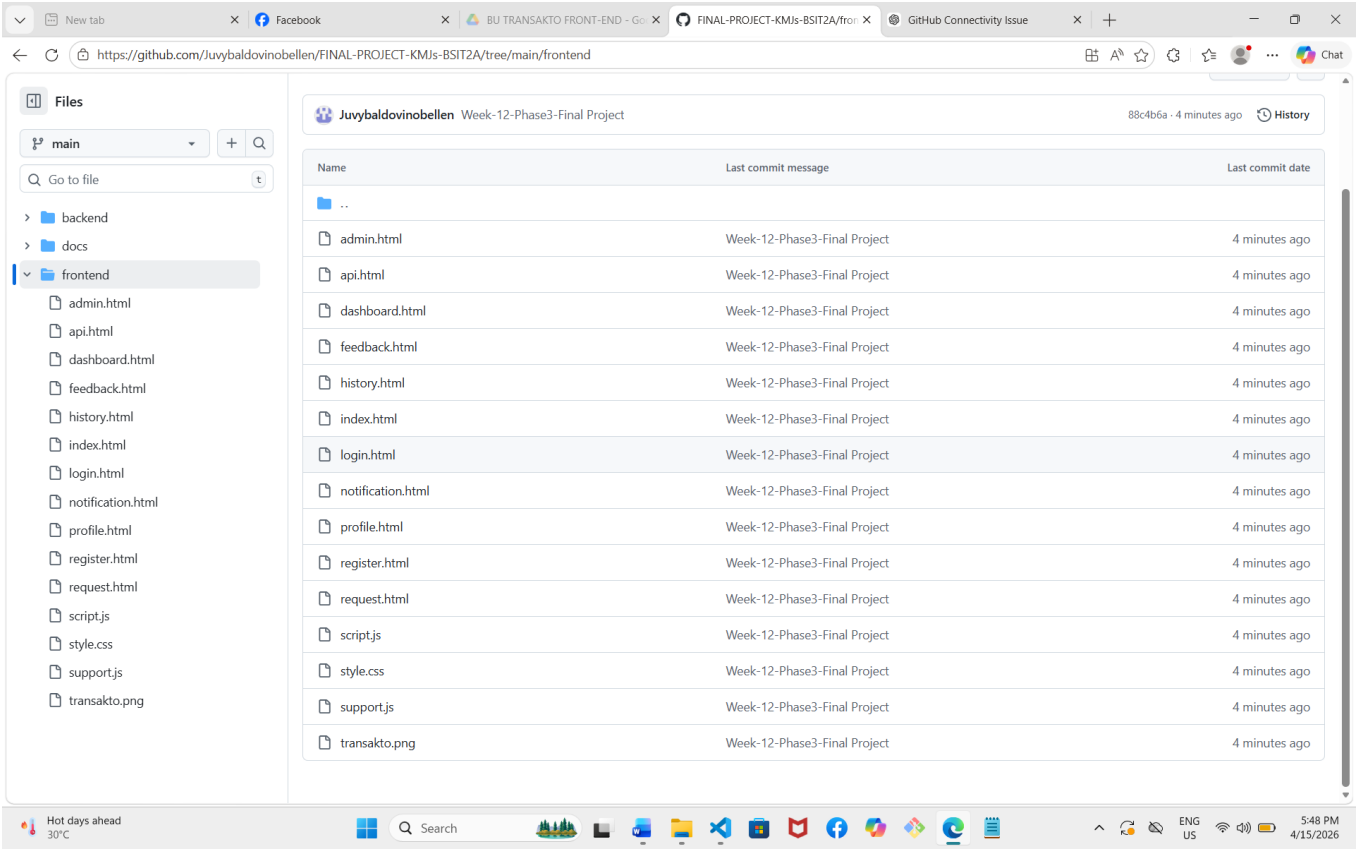
This page allows staff members to manage and update their personal and account information.

Figure 15: Settings Page (Staff) – implements Manage System Settings Use Case.

This page allows staff to configure system-related settings such as account security, preferences, and other administrative options.

GitHub Repository



Individual Reflections

Janet L. Realubit (Back-end)

As the Backend Manager for Phase 3, I contributed by helping ensure that the frontend design aligns properly with the system's ERD and planned backend structure. I reviewed the forms and inputs to make sure that all fields match the required database attributes so that future API integration will be smooth and consistent. I also helped define the initial API endpoint structure and data flow between the frontend and backend, which will be implemented in the next phase. In addition, I supported the team by preparing placeholder JavaScript functions and guiding proper naming conventions for form fields and GitHub commits. Overall, my role focused on making sure the frontend is properly structured and ready for backend integration in the next development phase.

Kimberly Anne R. Intia (Front-end)

As a front-end developer in Phase 3 of our project, I focused on transforming our system design into a functional and user-friendly interface. I reviewed the ERD, use case diagrams, and system flow to understand the required pages and features. Based on this, I created and organized the HTML pages such as login, register, and dashboard, ensuring they aligned with the system's data and user roles. I used Bootstrap to design a clean and responsive layout and developed forms with proper structure and input fields. I also created two separate interfaces for students and staff to make registrar transactions more efficient and to improve the process of requesting documents. I prepared the interface for backend integration by adding placeholders and basic scripts. Throughout the development process, I collaborated with my team to keep everything consistent with our project plan. With the help of Janet as the back-end developer and Jesseca as the tester and debugger, we successfully implemented the system while improving both my technical and teamwork skills.

Juvy B. Bellen (GitHub Manager)

On week 12, where this focused on the phase 3 of our group project which is the front-end setup, my contribution to this phase, since I was assigned as the repository manager, I was the one responsible and handling the version control process, especially in committing the front-end updates connected to the repository. This is just to ensured that all the back-end development where it's properly tracked, organized, and also synchronized within our group.

Jesseca Mae M. Septo (Tester & Debugger)

In the second half of the final group project (which was Phase 3), I was a tester and debugger. My responsibility was to make sure the front-end pages were working properly and match with the design that we planned. I mainly helped debug the website when there was a system error (e.g. system wasn't able to get to the next page) and tested which aspects of the frontend code (link, form action, basic logic, etc.) might have caused the error. I was able to work with my groupmates on the front end to help debug and troubleshoot the problems we were experiencing. Working together, we were able to make system connections more consistent and make the flow of information through the applications more logical. This experienced made me more familiar with the interaction between front end components and the necessity for early debugging. Overall, my participation helped to build a more usable final product and helped us reach our Phase 3 goals.

Ma. Mera G. Hermo (Database Manager)

As the MongoDB Manager during Phase 3, I focused on making sure that our planned database structure matched the frontend development based on our ERD, use case, and system architecture. While the team was building the HTML pages and forms, I checked if the input fields and data being collected were aligned with what we designed in the ERD, since this is important for smooth backend integration in the next phase. I also worked with my groupmates to ensure that the structure of the data would support the system's features and user roles. This experience helped me see how frontend development and database planning must go hand in hand to build a functional and well-organized system.
